technology with performance.

SH 800 Classic Natural Preamp System

Graphic Equalizer:

Graphic equalizer boosts or cuts the level of signal at specific frequencies
Shadow preamps are made with two, three, four or five different frequency bands. All bands will boost or cut by 12 dB.

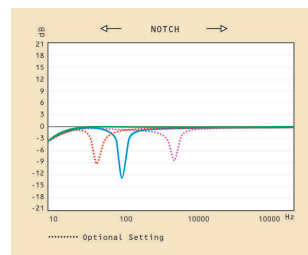

Master volume Control

NOTCH control:

Feedback can be experienced in situation where higher volume is used. This is a case when a very specific frequency gets an infinitive boost.

With Notch control you can move the pot to the specific feedback frequency and cut this very narrow frequency off. This will stop the feedback. You will use this feature on the stage. In case you are recording in the studio you do not want to cut any of the frequency range. Therefore we have built in the Notch on/off switch.

PHASE switch inverts the signal and cancels the overall feedback.

EQ-SHAPE switch:

If you have this switch in OFF position and your tone (EQ) controls are in middle position, the signal will have a flat frequency curve.

When you turn the EQ-Shape switch ON, it will boost the bass and treble and it will cut tone control pot positions. Now you can use your tone controls to trim to desired sound more effectively than any other preamp can do.

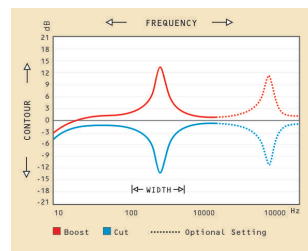

Parametric Equalizer and its controls:

Parametric equalizer allows you to determine the frequency which you would like to boost or cut.

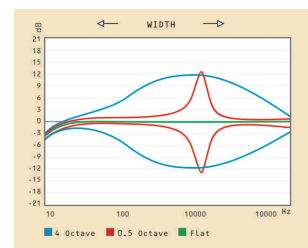

CONTOUR control pot determines the level of boost or cut. When this potentiometer is in the middle position, there is no parametric effect.

Parametric Controls

FREQUENCY control pot selects the frequency that you want to boost or cut. It has a range from 250 Hz (Bass) to 10 KHz (treble).

WIDTH control pot (Q) adjusts the width of the frequency band selected. It can select from a very narrow band (0,5 octave) to a very wide band (4 octave).

Push to access the battery compartment.

To achieve best acoustic sound with microphone: bend the microphone to the bottom of the guitar about 10 mm above the bottom.

5 years warranty for all Shadow products
