

Installation Instruction for Shadow SH B1 Banjo Twin Bridge Transducer

Content:

2 Tonabnehmersensoren (je 12 mm Durchmesser) mit 6,3 mm Klinkenbuchse und Klettband

1. Loosen strings.
2. Install the sensors under the feet of the original bridge (see Fig. 1). If the strings are too high, remove a small amount of wood from all 3 feet of the bridge.

Note: For proper audio output, the sensors must be under string pressure so be sure the center foot is not too high.

3. Retune the instrument.
4. Mount the output socket holder in a convent location on the instrument with the applied double sided adhesive.
5. Connect to an appropriate amplifier with standard instrument cable.

Note:

Piezo pickups and transducers have a very high output impedance. In order to get the optimum sound output we recommend an amplifier with low impedance input.
